

RURAL ECONOMIC CONDITIONS & SENTIMENTS SURVEY

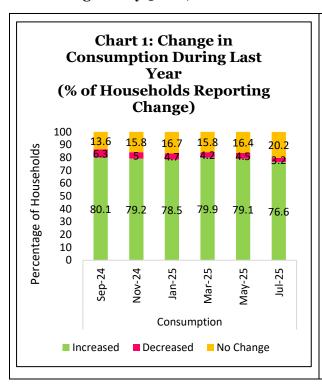

Bi-monthly Survey Report Round 6 (July 2025)

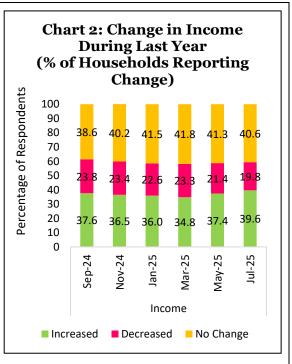

Rural Economic Conditions and Sentiments Survey¹ (July 2025)

The July 2025 round of the Rural Economic Conditions and Sentiments Survey (RECSS) was conducted during the last week of June 2025 and the first week of July 2025. As in the previous rounds of the survey, it captures quantitative and qualitative data, both backward looking (economic conditions) and forward looking (household sentiments), on a limited set of key macro-financial parameters relating to the rural economy (please refer to Annex 1 for the survey methodology and sample coverage, and Annex 2 for the Survey Questionnaire).

Rural Economic Conditions

Consumption-led growth buoyancy in the rural economy seems to have continued, with 76.6% of the surveyed households reporting an increase in consumption during the last year, and the share of those that experienced a decline in consumption moderating to only 3.2 %, which is the lowest since this survey started (Chart 1).

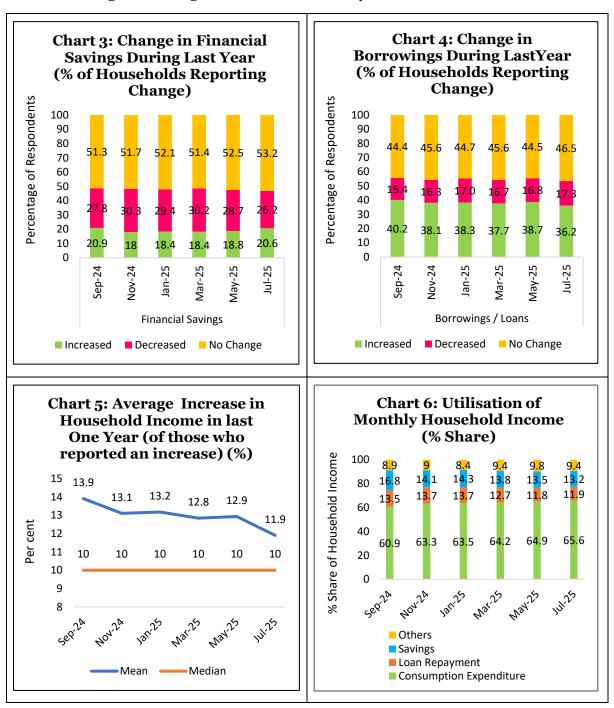

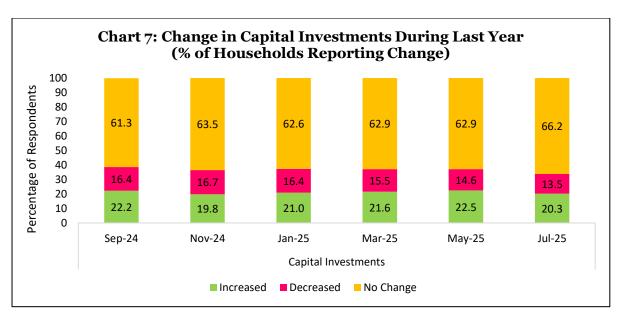

Sequential changes observed in key macroeconomic parameters - income, consumption, savings, borrowings, and capital investment - suggest that despite a higher percentage of households reporting an increase in income in the July 2025 round of the survey (Chart 2), the share of those reporting an increase in consumption moderated (Chart 1), reflecting possibly: (i) a higher percentage of households reporting an increase in financial savings (Chart 3), (ii) a lower percentage of households reporting any increase in borrowings (Chart 4), and (iii) a lower rate of average increase in household income relative to all previous rounds of the survey

¹ The survey was commissioned by the Department of Economic Analysis and Research (DEAR), NABARD. Its findings do not reflect the views of NABARD.

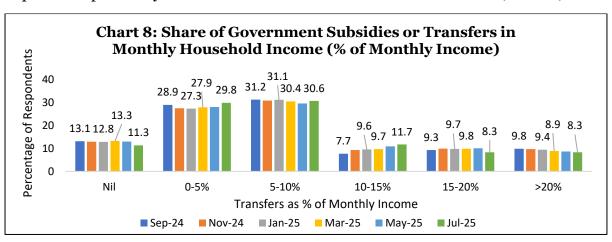

(Chart 5). Moreover, the average share of income spent on consumption rose to 65.6%, which is the highest among all rounds of the survey (Chart 6).

A lower percentage of households reported any increase in capital investments in the July 2025 round of the survey relative to preceding three rounds of the survey (Chart 7).

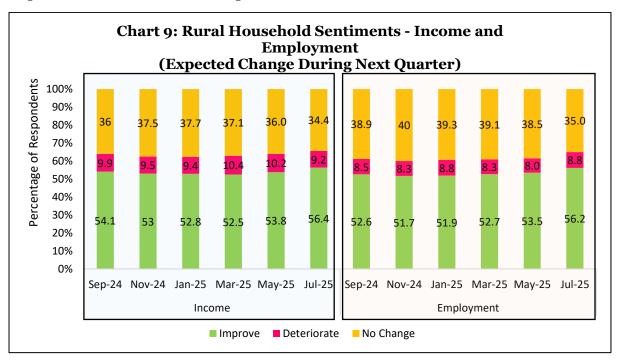

Income and consumption of the rural households are supported by several fiscal transfer schemes, in both kind and cash, by the central government and state governments, in the form of free/subsidized provision of food, water, electricity, cooking gas, fertilizer; interest subventions; school uniform, books and computers; public transportation; mid-day meal; student scholarships and pensions (for old age, widows, disabled, artisans, *etc.*). Such transfers, as reported by the survey participants, remained unchanged at about 10 % of their average (mean) monthly income, with a wide distribution, suggesting that a segment of the rural households depend comparatively more on such transfers relative to their income (Chart 8).

	Round 1	Round 2	Round 3	Round 4	Round 5	Round 6
	(Sept 2024)	(Nov 2024)	(Jan 2025)	(Mar 2025)	(May 2025)	(July 2025)
Mean	9.75	10.09	10.3	9.9	10.0	10.01
Median	8	8	8	8	8	8

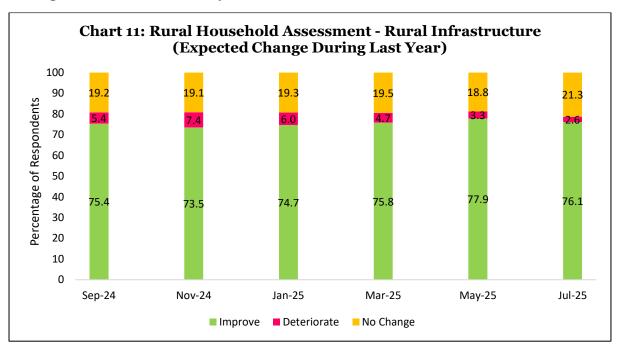

Rural Household Sentiments

Rural sentiments remained upbeat, reflecting partly the impact of satisfactory progress of the southwest monsoon. A higher percentage of households expect income and employment conditions to improve during the next quarter, and the share of those reporting an improvement peaked in the July 2025 round of the survey (Chart 9). One year ahead sentiments regrading income prospects in rural areas improved further, and the percentage of households reporting one year ahead income conditions to improve from the current levels peaked at 74.7% (Chart 10).

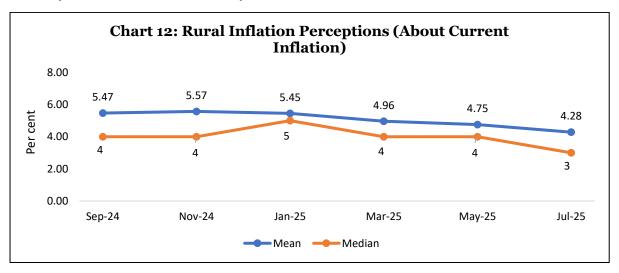

The assessment of rural households about the state rural infrastructure improved, with the share of those reporting a deterioration declining to 2.6%, which is lowest among all rounds of the survey (Chart 11).

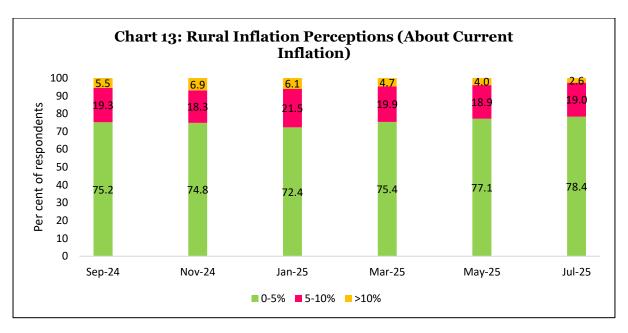

Rural Inflation Perceptions and Inflation Expectations

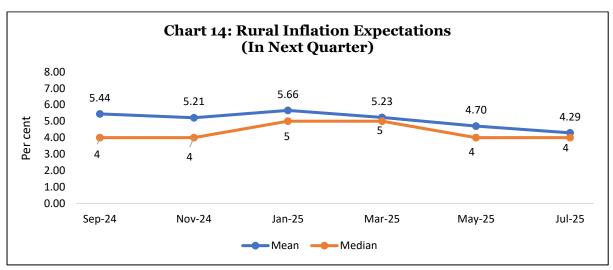

When the survey was conducted during the last few days of June 2025 and the first few days of July 2025, inflation data on CPI-rural inflation was available for the month of May 2025, which had declined to 2.59% from 2.92% in April 2025 and 3.25% in March 2025. Rural food inflation had softened to 1.36% in May 2025.

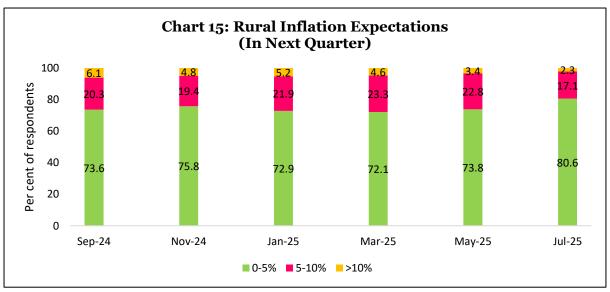

In the July 2025 round of the survey, the average (mean) value of inflation perceptions of rural households moderated further to 4.28%, and the median value fell to 3%, which is the lowest since this survey started (Chart 12). Highest percentage of households (78.4%) also perceived realised inflation to have been at or below 5% in the July 2025 round of the survey (Chart 13).

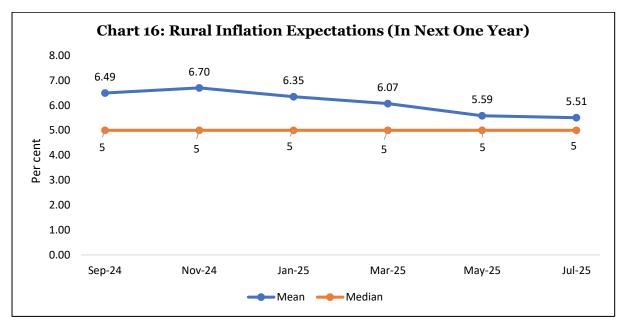

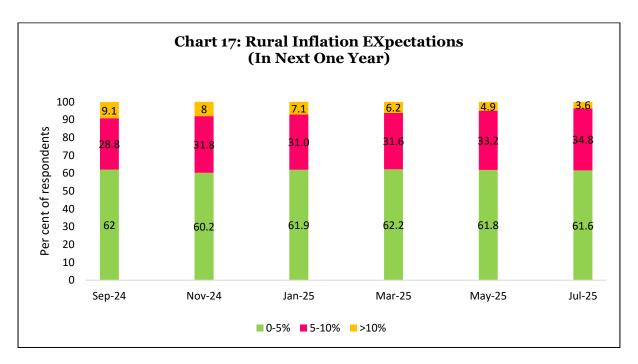

Inflation expectations of the rural households for the next quarter softened significantly (by 41 basis points) to 4.29%, which is the lowest level since the survey started (Chart 14 and 15).

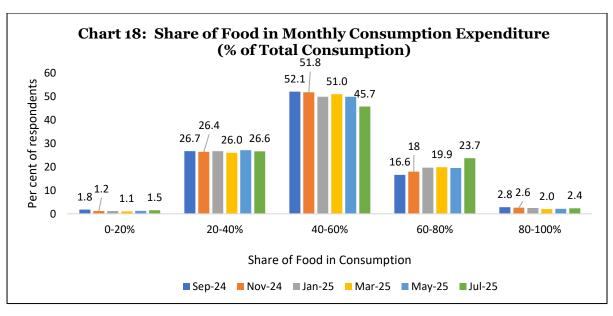

One year ahead inflation expectations, however, softened only marginally by 8 bps, and remained above 5.5%. The median one year ahead inflation expectations showed stability at 5% (Chart 16). 61.6% of the households expect inflation to remain below 5% in the next one year (Chart 17).

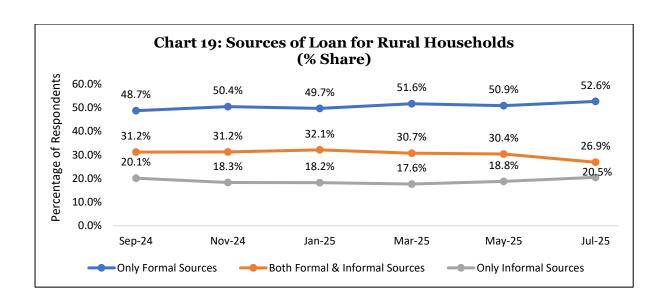

Despite sharp moderation in actual rural food inflation in May 2025 (the last inflation print that was available at the time of the survey), households reported their share of food consumption in total monthly consumption remaining unchanged at 50% (median value) (Chart 18).

	Round 1	Round 2	Round 3	Round 4	Round 5	Round 6
	(Sept 2024)	(Nov 2024)	(Jan 2025)	(Mar 2025)	(May 2025)	(July 2025)
Mean	52.4	53.5	53.6	53.2	52.5	53.8
Median	50	50	50	50	50	50

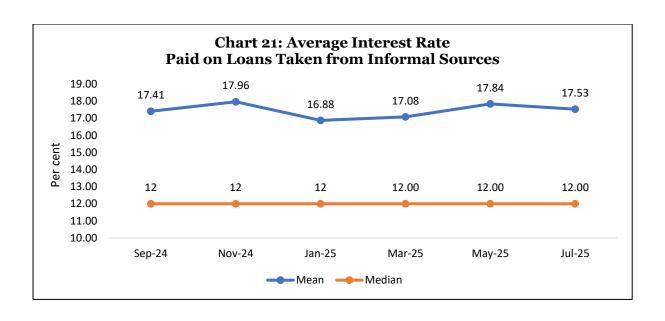

Rural Credit Conditions

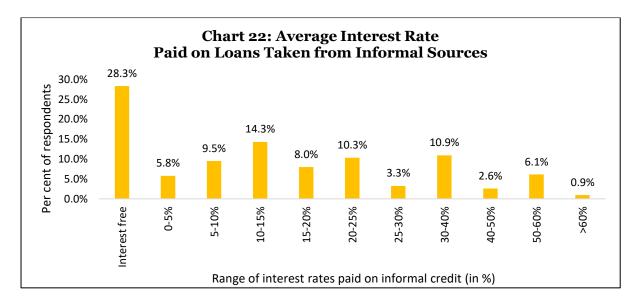

Reflecting the impact of sustained policy thrust on promoting financial inclusion, credit sourced by households from formal institutional sources dominates. While some households borrow from both formal and informal sources, the latter is dominated by loans taken from friends and relatives. The share of households that reported to have taken loans from only formal sources peaked at 52.6% in the July 2025 round of the survey (Chart 19). Among various informal sources of credit, the share of friends and relatives was more than the share of moneylenders (Chart 20).

The average interest rate paid on informal credit declined by about 30 basis points in the July 2025 round of the survey (Chart 21). Since information on interest rates paid on formal credit is available from official sources, it may be noted that this survey aims to capture data only on average interest rate paid on informal credit. The median interest rate on such informal loans has remained unchanged at 12%. While close to 30% of the rural households pay no interest (reflecting possibly the part of loans taken from family and friends), more than one third of the rural households pay a high interest rate on informal credit at more than 20% (Chart 22).

Rural Economic Development Performance Ranking

In this survey, respondents reveal their satisfaction/dissatisfaction regarding various rural development indicators by ranking them. Rural roads maintained its top rank in the July 2025 round of the survey, with majority (46.3%) of rural households expressing satisfaction about improving conditions of rural roads, followed by education (11.2%) and drinking water facilities (10%) (Chart 23; Table 7).

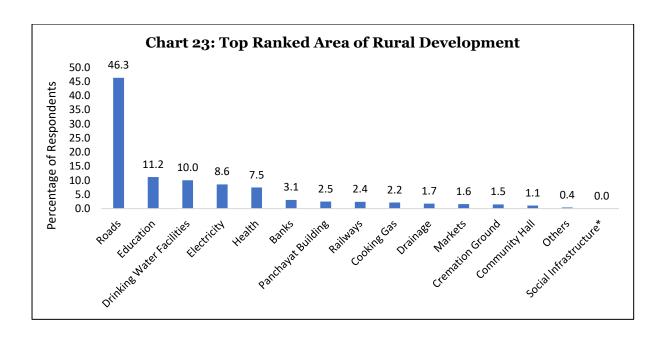

Table 1 presents a summary assessment of the changes in the perceptions and sentiments of the rural households over the two consecutive rounds of the survey. Other than financial savings, in terms of net responses, the July 2025 round of the survey suggests positive economic conditions and sentiments continuing (depicted through green arrows) and even for financial savings there is some improvement (depicted through a negative arrow that is moving up).

NOTE: In view of the seasonality in some of the economic parameters in rural areas, and possible unevenness in the initial rounds in explaining the questions to the survey participants from 600 villages spread across the country, the survey findings may take some time to stabilise. Experience gained from the initial rounds will be considered while conducting the survey in future, with the aim of generating a time series of information on the select parameters that can help in assessing the changing dynamics in the rural economy.

The Survey questionnaire (Annexure 2) was designed in the Department of Economic Analysis and Research (DEAR), NABARD, keeping in view the requirement of regular flow of information for monitoring developments in the rural economy, and the Academy of Management Studies (AMS) conducted the survey, after finalising the sampling design (Annexure 1) in consultation with DEAR.

Annexure 1: Sampling Design of the Survey

Survey Frequency and Periodicity: The survey is designed to be carried out as 6 bi-monthly rounds per year, with the first round starting from August/September 2024. The interviews of each round shall be conducted during the last week of a particular month and the 1st week of the subsequent month. Accordingly, the said surveys shall be carried out in August-September, October-November, December-January, February-March, April-May, and June-July every year. The 1st round of the survey was conducted during 27 August 2024 to 05 September 2024.

Sample Size: For each round of the RECSS, the sample size will be 600 villages covering 6000 households (10 households from every sample village).

Geographical coverage: Due to the very short duration of the survey for each round, it has been decided to select the villages from 28 States and 1 Union Territory (viz. Jammu & Kashmir) of India. These 28 States and 1 UT together account for 99.15% of the total rural population of the country.

Sampling Frame: The list of districts and villages in these 28 States and 1 UT will constitute the sampling frame. The population of the villages were first updated with the population figures available in the Mission Antyodaya (MA) database for 2020. Next, for the remaining villages populations were estimated using the projected population of 2018 published by the Office of the Registrar General & Census Commissioner, India (ORGI). However, for the newly formed villages (i.e. those not available either in Census 2011 or in Mission Antyodaya), the population was estimated as the average of the population of newly formed villages available in the Mission Antyodaya database for the state/ UT.

Sample Allocation to States and UT

Drawing insights from the approach adopted by the National Sample Survey Office (NSSO), it was decided to represent all the NSS-Regions falling in 28 states and 1 UT. An NSS-Region is a group of Districts within each State and Union Territory having similar agro-economic conditions. Altogether, there are 80 NSS-Regions covering 28 States and the Union Territory of Jammu & Kashmir.

600 sample villages were allocated to 28 States and 1 UT in proportion to their population, ensuring a minimum sample allocation of 2 districts per NSS region and 2 villages per sample district. While doing this, it was observed that in Jammu & Kashmir and in 10 states (Uttarakhand, Himachal Pradesh, Tripura, Meghalaya, Manipur, Nagaland, Arunachal Pradesh, Goa, Mizoram, and Sikkim), due to their comparatively lower total population, the proportional allocation approach did not meet the minimum sample requirement of 2 villages per sample district. Hence, for these 10 states and 1 UT, 2 villages were purposely allocated to each of the 2 sample districts in every NSS region to ensure minimal sample to estimate their key parameters. Accordingly, a total of 60 villages were allocated to these 10 states and 1 UT. Thereafter, the remaining 540 villages were distributed across 18 bigger states in proportion to their population. The final sample allocation for RECSS is depicted in Table 1.

Table 1: Sample Allocation for the States/UTs

SN	State	Total NSS Regions	Allocated Number of Sample Districts	Allocated Number of Sample Villages

Sampling Design and Approach Adopted for Sample Selection

Outline of Sampling Design: A stratified multi-stage sampling design was adopted for the RECSS survey. The RECSS will cover all NSS-regions across 28 States and 1 UT of J&K. The districts within each NSS region constitute the First-stage Sampling Units (FSUs). The census villages in the selected districts constitute the Second-stage Sampling Units (SSUs). To ensure representation of all socio-economic strata within each sample village, in consultation with knowledgeable local persons, the hamlets within the village were classified (to the extent possible) in three economic categories (i.e., well-off, middle-income, low-income) and were considered as the Third-stage Sampling Units (TSUs). Finally, the households in the selected hamlets were considered as the Ultimate-stage Sampling Units (USUs).

Selection of Districts (FSUs): Sample districts (FSUs) have been selected using Circular Probability Proportional to Size (Circular PPS) sampling method, where size is taken as the estimated current population of the FSUs. Using this method, 2 districts have been sampled from each NSS region. For selection of the FSUs from each NSS region, they were first arranged (sorted) by District Code used in Census 2011. Having arranged the FSUs in this order, the required number of sample FSUs were selected following Circular PPS sampling method. Accordingly, a total of 160 districts were sampled across 80 NSS-regions falling in the sample frame. One NSS region, namely Kuchchh in Gujarat, had just 1 district. Therefore, as a special case, we treated its subdistricts as FSUs and selected 2 sub-districts using the Circular PPS sampling method.

Selection of Villages (SSUs): All the villages within the sample frame of the selected districts were arranged in order of the Village Code allocated to them as per Census 2011. After this, the allocated number of villages to each NSS region were divided proportionately between its two selected districts. Thereafter, the allocated number of villages were sampled from each selected district using Circular PPS approach. Using this approach, a total of 600 villages were sampled from 160 districts sampled in the preceding stage.

Selection of Hamlets (TSUs): When the field survey started, the investigators visited the sampled villages and held consultations with the Panchayati Raj Institution (PRI) members and other knowledgeable local persons of the community to identify the boundaries of each selected village and prepare a rough map showing the location of various hamlets within the village. A structured format was used to capture the details of all hamlets within the village along with the number of households within each hamlet. Further, the investigators also consulted with the knowledgeable local persons to categorize these hamlets on the basis of the general economic status of the households residing therein. Thus, all hamlets in each selected village will be categorized into 3 strata, namely, low-income, middle-income and the well-off. Finally, from each of the 3 strata, 1 hamlet was selected using Simple Random Sampling approach.

Selection of Households (USUs): After the selection of 3 hamlets, the allocation of 10 households among these 3 were made in proportion to the total households in their respective strata. Thereafter, the allocated number of households were sampled from each hamlet using Systematic Random Sampling method. The first sample household in the hamlet was selected randomly from the centre of the hamlet. A sampling interval (say 'n') was calculated by dividing the total number of households

in the respective hamlet by the number of households sampled. After the first household, the investigators selected every nth household following a right-hand rule for movement between households.

Sampling shall involve a mix of panel (without replacement) and cross-sectional (with replacement) data. Out of the 6000 sample households surveyed in every round, 50% of the households (i.e., 3000 households) shall remain fixed in every round of the survey (forming a panel without replacement) while the remaining 50% of the households shall be replaced with new households in every round of the survey (forming a cross-sectional data with replacement). At the village level, out of the 10 households to be surveyed in every sample village, 5 households shall remain fixed and the remaining 5 households shall be replaced with new households in every round of the survey.

Calculation of Weights Based on Probability Proportional to Size (PPS) Sampling: When a household is selected from a village, a village from a district, and a district from an NSS region, each can be selected with a probability that is proportional to the size (of the village, district and the NSS region for which the population numbers are available). The sample survey results, therefore, need to be adjusted, based on probability of each sample unit, to accurately reflect the response of the entire population. Probability proportional to size (PPS) sampling is widely used to correct for possible imperfections / biases in survey data.

If a unit is included in the sample with probability p_i , then its base weight, denoted by w_i , is:

$$w_i = 1/p_i$$

For multi-stage sampling designs, the base weights must reflect the probabilities of selection of units at each stage:

$$p_{ij} = p_i^* p_{j(i)}$$

This survey involved a multi-stage sampling design, and the related step-by-step process of weight calculation for arriving at the estimates (i.e., findings reported as mean/median) is presented below.

1. Estimation of Probability of Selection of Districts

In the first step, 2 districts are sampled from each NSS Region. The districts [First Stage Units (FSUs)] are selected using Circular Probability Proportional to Size (Circular PPS) sampling method, where the estimated current population of the FSUs is taken as indicative of size. Thus, a total of 160 districts are sampled across 80 NSS regions in the country. The formula used for calculating the probability of selection of a district is as follows:

Probability of the District being selected
$$=$$
 $\frac{\text{Estimated Population of the Selected District}}{\text{Estimated population of the respective NSS Region}}$ \times Number of Districts to be selected from this NSS Region

2. Estimation of Probability of Selection of Villages

In the next stage, a total of 600 villages (Second-stage Sampling Units (SSUs)) are sampled from 160 districts using Circular PPS sampling approach. In this stage also the population of the villages is taken as an indicator for size while applying circular PPS sampling approach. For calculating the probability of selection of villages, the following formula is used:

3. Estimation of Probability of Selection of a Household

In each SSU village, the investigators are required to list down the details of all hamlets along with the estimated number of households in each, as well as classify them based on the general economic condition of the households residing therein in consultation with local knowledgeable persons. The hamlets in each selected village are categorized into 3 strata based on economic profile of households – low income, middle income, and high-income hamlets. Since income threshold for such a classification could vary across villages, no uniform threshold is used, and investigators used local information to achieve the goal of covering households under three different income brackets. From each of the 3 strata, 1 hamlet is selected using Simple Random Sampling approach. After the selection of 3 hamlets, the 10 households to be sampled from the village are distributed across three strata in proportion to the total households in their respective strata. Finally, the required number of households are sampled from each hamlet using Systematic Random Sampling method. The formula used for calculating the probability of household selection is as follows:

Probability of the HH being	=	respective strata				
selected		Estimated Households in all hamlets of a respective strata				

4. Estimation of Joint Probability and Survey Weight

After calculating the probability of selection of units at all stages of sample selection, a joint probability is calculated for each household using the following formula -

Joint		Probability of		Probability of		Probability of
Probability	=	Selection of a	X	Selection of a	X	the Selection
Probability		District		Village		of a Household

The survey weight (or the factor) is calculated as an inverse of the joint probability of selection of a sample household. The factor thus calculated has been duly integrated into the cleaned dataset, which are used to generate weighted estimates (of mean/median) for all key indicators in the survey.

Survey Weight = 1 / Joint Probability

By using PPS sampling, how the mean and median numbers for inflation perceptions and inflation expectations change between unweighted and weighted data could be seen from Table A. The assessment presented in this report is based on weighted estimates for all variables (Table 3).

Table A: Inflation Perception and Expectations (Sept 2024)								
	Unweighted				Weighted			
	Mean	SE	Median	SE	Mean	SE	Median	SE
Current Inflation Perception	5.58	0.0468	4	0.0587	5.47	0.0002	4	0.0002
Inflation Expectations in next quarter	5.53	0.0466	4	0.0584	5.44	0.0002	4	0.0002 7
Inflation Expectations in next year	6.56	0.0516	5	0.0647	6.49	0.0002	5	0.0003

Note: Please refer to Annex 1 for calculation of weighted and unweighted averages.

An example showing how the survey estimates have been adjusted is set out below: Bijnor district of Uttar Pradesh is one of the districts in the NSS region of Northern Upper Ganga Plains from which 2 districts are selected as samples for this survey. The probability of selection of Bijnor district from the NSS region of Northern Upper Ganga Plains (P1) is given by:

Probability of	Estimated Population of Bijnor	Number of Districts selected from
Bijnor District being selected (P1)	= Estimated population of Northern Upper Ganga Plains NSS Region	X Northern Upper Ganga Plains NSS Region

P1 = (3650839/18001239) *2 = 0.4056208575

In the district of Bijnor, Kamala is one of the 5 villages selected as sample for the survey. The probability of selection of Kamala village from Bijnor district (P2) is given by:

Probability of Kamala Village being selected (P2) =
$$\frac{\text{Estimated Population of Kamala}}{\text{Estimated population of Bijnor}} \times \frac{\text{Number of sample}}{\text{X}} \times \text{Villages selected}$$
in Bijnor District

 $P_2 = (2127 / 3650839) *5 = 0.0029130290$

In the village of Kamala, 5 households of middle-income strata are selected as samples for the survey. The probability of selection of any one of these households (P3) is given by:

Kamala village

P3 = 5 / 175 = 0.0285714286

Now, the joint probability of selection of this household in Kamala village of Bijnor district in the NSS region of Northern Upper Ganga Plains is given by:

Joint Probability = P1 * P2 * P3 = 0.0000337596

Finally, the weight used to adjust the response of each of such household is given by:

Survey Weight = 1 / Joint Probability = 1 / 0.0000337596 = 29621.2207334274

Annexure 2: Questionnaire Used for the Survey

Rural Economic Conditions – Qualitative Information

- 1. Income (change during last 12 months):
 - Increased
 - Decreased
 - No Change
- 2. Consumption (change during last 12 months):
 - Increased
 - Decreased
 - No Change
- 3. Financial Savings (change during last 12 months):
 - Increased
 - Decreased
 - No Change
- 4. Borrowings, from formal and informal sources (loans taken during last 12 months):
 - Increased
 - Decreased
 - No Change
- 5. Capital investment made (in agriculture/business/construction of house) during last 12 months:
 - Increased
 - Decreased
 - No Change

Rural Economic Conditions – Quantitative Information

- 6. Percent of Average monthly income spent on:
 - a. Loan Repayment:
 - b. Savings:
 - c. Consumption:
 - d. Others (please mention):

(Please ensure that the responses to 6 (a) to 6 (d) add up to 100 for each respondent)

7. Percent of monthly income supplemented by subsidies/ transfers from the government in cash/kind?

Enter your answer

- 8. Percent of monthly consumption spending on:
 - a. Food
 - b. Fuel (Cooking plus Transportation)
 - c. Education and health
 - d. Others

(Please ensure that the responses to 8 (a) to 8 (d) add up to 100 for each respondent)

- 9. Percent of loan, if any, taken from:
 - a. Formal Sources Banks/NBFCs/RRBs/Urban and Rural Cooperatives/SFBs and MFIs
 - b. Informal Sources Relatives/friends/business partner
 - c. Informal Sources Moneylenders/others

(Please ensure that the responses to 9 (a) to 9 (c) add up to 100 for each respondent)

10. Average interest rate paid on loans taken, if any, from informal sources (in per cent per annum):

Enter your answer

(Please ensure that the EMI or monthly/quarterly rate of interest are adjusted as per the annual rate of interest applied to the loan value)

Rural Household Sentiment

- 11. Employment Outlook (Next One Quarter):
 - Expect to Improve
 - Expect to Deteriorate
 - Expect to Remain Unchanged
- 12. Income Outlook (Next One Quarter):
 - Expect to Improve
 - Expect to Deteriorate
 - Expect to Remain Unchanged
- 13. Income Outlook (Next One Year):
 - Expect to Improve
 - Expect to Deteriorate
 - Expect to Remain Unchanged
- 14. Your assessment of rural infrastructure situation in last One Year (Roads, Warehouses, Electricity Supply, Schools/Colleges, Hospitals/Health Centres, Drinking Water Supply):
 - Improving
 - Deteriorating
 - Remains Unchanged
- 15. What was the extent of increase in your income (salary/wage/business/farming) from all sources in last One Year (in per cent)?

Enter your answer

16. What is the current rate of inflation (year on year increase in prices) for your monthly consumption basket (in per cent)?

Enter your answer

17. Inflation Expectations in Next One Quarter (in per cent):

Enter your answer

18. Inflation Expectations in Next One Year (in per cent):

Enter your answer

19. What are the three areas where you have noticed major improvements in the last few years (Banks, roads, railways, education, health, electricity, cooking gas, markets, social infrastructure, etc.)?

Enter your answer
